

Year 1 – Grouping Data

Computers are not intelligent, they need input from humans to perform tasks. They use **labels** that we give objects to sort and arrange the information we give the computer.

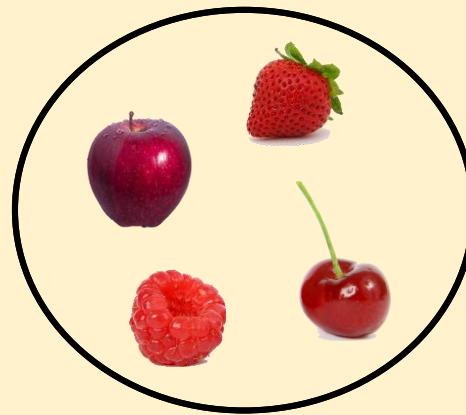

Search engines like Kiddle and Google use properties to show us what we are looking for.

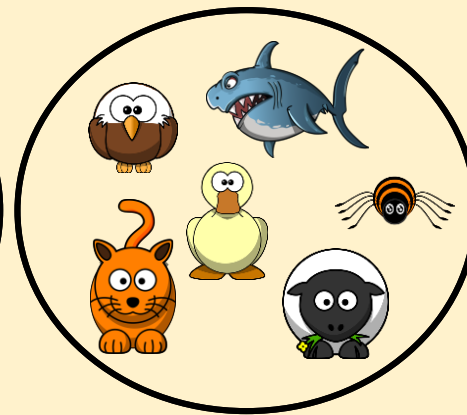

Objects are grouped by their **properties/labels** that we give them. Some of these properties could include:

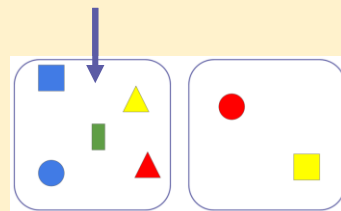

The property of this group is **red**.

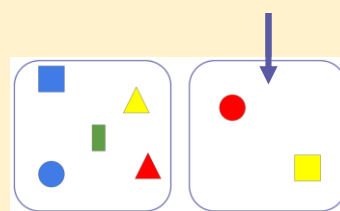

The property of this group is **animals**.
